UI and UX

- UX is the intangible design of a strategy that brings us to a solution
- The interface is not the solution
- UX is an acronym for “user experience”
- UX designer is the person in charge with creating the products “logic” via wireframes and prototypes via software

UI design is a part of UX

- UI design is a huge part of UX
- A good majority of cases the UX designer does in fact design the interface
- But UX is not UI
- A skillful interface designer understands the importance of **providing the user with a solution to a defined problem**

How you get to an effective UI (1/2)

- Presume the problem has been identified through the user/market/persona research
 - A user **persona** is a representation of the goals and behavior of a hypothesized group of users
 - In most cases, **personas** are synthesized from data collected from interviews with users
- User flows and stories are made, then trashed, then made again, then iterated on until the problem flow is clear

How you get to an effective UI (2/2)

- With an idea of ways to solve the problem, some rapid experiments are carried out to validate the assumptions with the persons
- Some Information Architecture is done to break out the product/site into the logical areas and hierarchies
- Various wireframes and sketches are drawn to start to organize where things could go on the screen
- With mockups and a UI designed, they are user tested and iterated on through some prototypes or experiments

Best Practices for UI Web Design

1. Understand how UI plays into UX
- 2. Know your audience**
3. Keep things simple and consistent
4. Implement a visual hierarchy
5. Make good use of typography

Identifying your audience

- You must have an idea of what your future audience will want
- You need to know what will bring people to your website and how it will provide a design that will draw them in further
- Using design patterns and styles that users are comfortable
- Take the design plays out among users and take users' feedback into consideration

Best Practices for UI Web Design

1. Understand how UI plays into UX
2. Know your audience
3. **Keep things simple and consistent**
4. Implement a visual hierarchy
5. Make good use of typography

Keep things simple

- The hallmark of a great interface is simplicity
 - Don't mean simply sticking a button or two here and there with some animations through in for the hell of it
 - It means **easy to understand and interact with**
- Users shouldn't need a map in order to navigate through your app or web site
- It's part of your job as an interface designer to subtly guide them from where they are to where they need to go

- For every message you write in UI, ask yourself: does the user really need to know this information?
- Write in small, scannable segments rather than long paragraph
- Keep sentences under 30 words when possible.

Concise

"1000 songs in your pocket."

Wordy

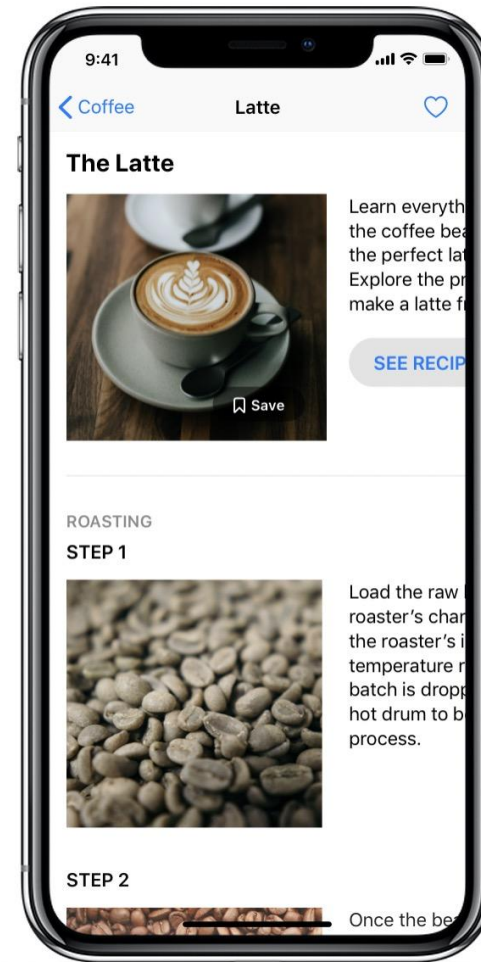

"Today we're introducing a new, portable music player that weighs a mere 6.5 ounces, is about the size of a sardine can, and boasts voluminous capacity, long battery life, and lightning-fast transfer speeds."

Formatting Content

Create a layout that fits the screen of a device. Users should see primary content without zooming or scrolling horizontally.

Sample simple and clean interface

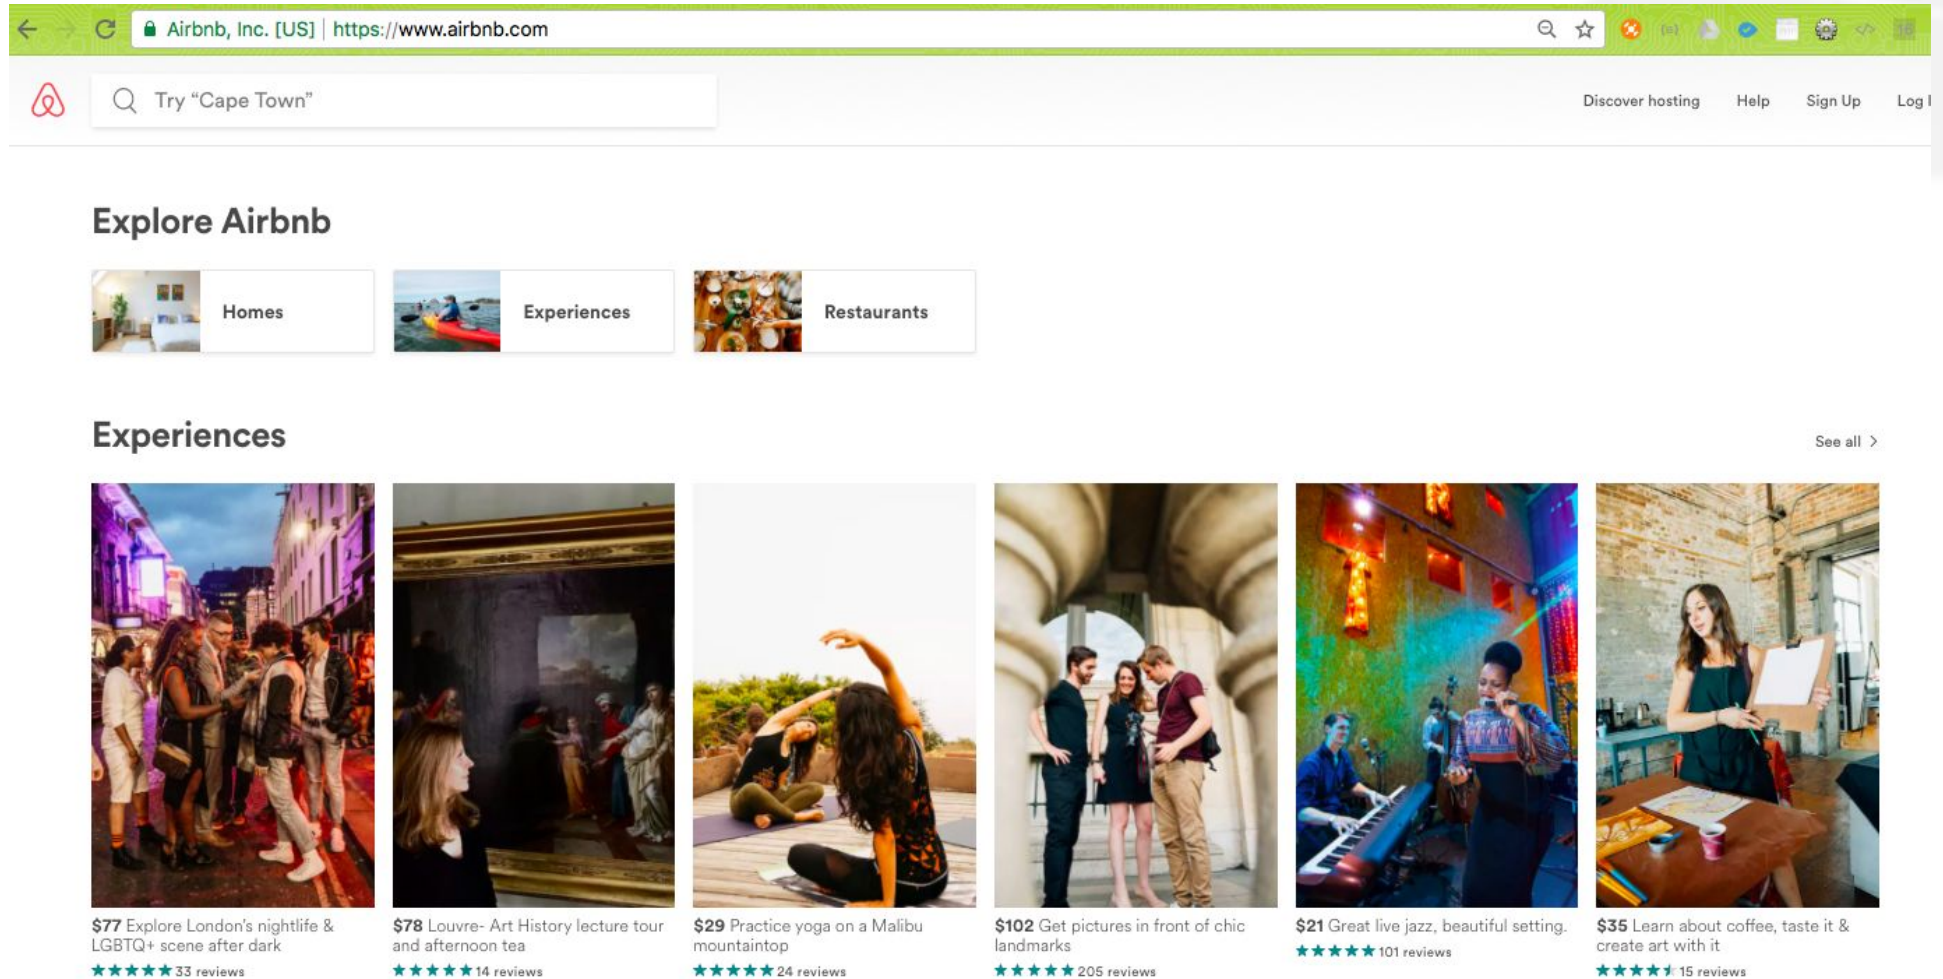

Implement a Visual Hierarchy

- The most important elements of an interface should be highlighted in order to make users focus on them
- The simplest example of this technique that comes to mind would be to make an element bigger in order to turn it into a focal point

Sample web with visual hierarchy

Best Practices for UI Web Design

1. Understand how UI plays into UX
2. Know your audience
3. Keep things simple and consistent
4. Implement a visual hierarchy
5. **Make good use of typography**

Make good use of typography

- When we talk about communication in web design context, we usually mean text
- More than 95% percent of information on the web is in the form of written language
- Good typography makes the act of reading effortless, while poor typography turns users off. As Oliver Reichenstein states in his article “Web Design is 95% Typography”

Optimizing Typography

- Optimizing typography is optimizing readability, accessibility, usability(!), overall graphic balance
- Optimizing your typography also optimizes your user interface
- Nick Babich suggested a set of rules that help you improve readability and legibility of your text content

Keep The Number of Fonts Used At a Minimum

- Using more than 3 different fonts makes a website look unstructured and unprofessional
- Keep in mind that too many type sizes and styles at once can also wreck any layout

Oh dear

*When you use **too many fonts***

see how they **all fight** for attention

In order to prevent situation like this one try to limit the number of font families to a minimum

Font families complement each other

- If you do use more than one font, ensure the font families complement each other based on their character width

Georgia
Verdana

Baskerville
Impact

Ensure the font families complement each other based on their character width

Try to use standard fonts

- Font embedding services (like Google Web Fonts or Typekit) have a lot of interesting fonts that can give your designs something new, fresh, and unexpected. They're also super easy to use
- Take Google for example:
 - Choose any font like Open Sans.
 - Generate the code and paste in your HTML document's *<Head>*.
 - Done!
- So what can go wrong?

Use system fonts or typical fonts

- Unless your website has a compelling need for a custom font, such as for branding purposes or to create an immersive experience
- It is usually best to stick with the system fonts
- The safe bet is to use a system font: Arial, Calibri, Trebuchet, etc.
- Keep in mind that good typography draws the reader to the content, not to the type itself

Limit line length

- Having the right amount of characters on each line is key to the readability of your text

Body Text	0	40	60	90

Ideal range	There were no fences at all by the roadside now, and the land was rough and untilled. Toward evening they came to a great forest, where the trees grew so big and close together that their branches met over the road of yellow brick.			
Too wide	There were no fences at all by the roadside now, and the land was rough and untilled. Toward evening they came to a great forest, where the trees grew so big and close together that their branches met over the road of yellow brick. It was almost dark under the trees, for the branches shut out the daylight; but the travelers did not stop, and went on into the forest.			

If a line is too short, the eye will have to travel back too often, breaking the reader's rhythm. If a line of text is too long, the user's eye will have a hard time focusing on the text. Image credit: Material Design

Line length for mobile devices

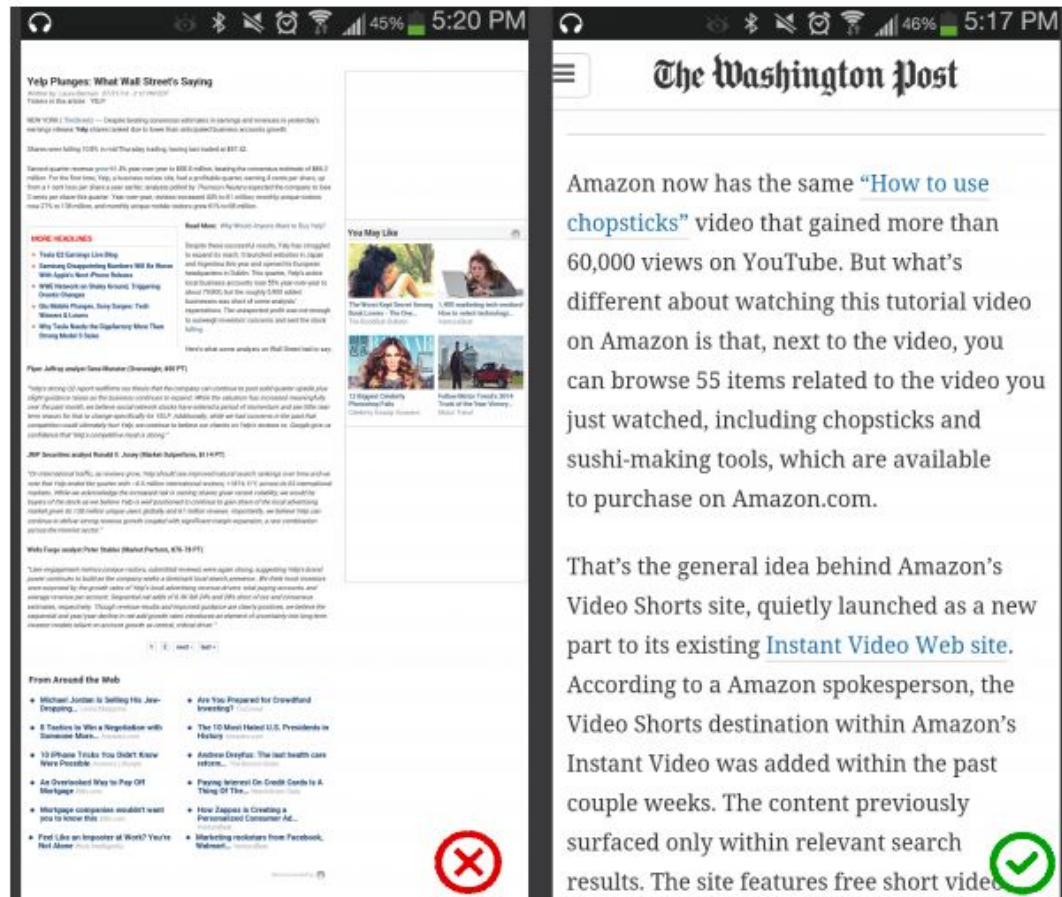

Image credit: Usertesting

Line lengths for mobile devices and web design

- For mobile devices, you should go for 30–40 characters per line
- The first one uses 50–75 characters per line (optimum number of characters per line for print and desktop)
- The second one uses the optimal 30–40 characters
- In web design you can achieve an optimal number of characters per line by restricting the width of your text blocks using em

Choose a Typeface That Works Well In Various Sizes

- Users will access your site from devices with different screen sizes and resolutions
- Most user interfaces require text elements of various sizes
- It's important to choose a typeface that works well in multiple sizes and weights to maintain readability and usability in every size
- For more information, go to [Material Design](#)

Use Fonts With Distinguishable Letters

- Many typefaces make it too easy to confuse
 - similar letterforms, “i”s and “L”s
 - poor letter spacing, such as when an “r” and “n” look like an “m”
- When choosing your type, be sure to check your type out in different contexts to make sure it won’t cause an issue for your users

Avoid All Caps

- All caps text — meaning text with all the letters capitalized — *is fine in contexts that don't involve reading* (such as acronyms or logos)
- When your message involves reading, don't force your users to read all caps text
- As mentioned by Miles Tinker, all-capital print greatly retards the speed of scanning and reading in comparison with lower-case type

Avoid All Caps and Bold

CAPITALIZING FULL PARAGRAPHS IS BAD.
THIS IS EVEN HARDER TO READ WHEN
IT'S BOLDEN. ARE YOU HAVING FUN
READING THIS?

Don't Minimize Spacing Between Lines

- As a rule, leading should be about 30% more than the character height for good readability

Make Sure You Have Sufficient Color Contrast

- Don't use the same or similar colours for text and background
- The more visible the text, the faster users are able to scan and read it

These lines of text do not meet the color contrast ratio recommendations and are difficult to read against their background colors.

These lines of text meet the color contrast ratio recommendations and are easy to read against their background colors.

Avoid coloring text in red or green

- Color blindness is a common condition, especially amongst men (8% of men are colour blind)
- It's recommended to use other cues in addition to color to distinguish important information
- Avoid using red and green colors alone to convey information because red and green colour blindness is the most common form of colour blindness.

Avoid Blinking

- Content that flashes or flickers can trigger seizures in susceptible individuals
- Not only can it cause seizures, but it's likely to be annoying or distracting for users in general

Avoid blinking text!

Best Practices for UI Web Design

6. **Use color and contrast properly**
7. Consider feedback messages
8. Be forgiving
9. Apply agile in design process
10. Using prototyping tools

Picking Right Colors

- Picking the right colors for any given design is a science in and of itself
- Color has been found to have connections to health and it can help set the mood through which your designs are seen
- It's not enough for a designer to use a color simply because he or she likes that color

Color Meaning

- There is no substantive evidence that supports a universal system of color meaning
- While some color symbolism exists globally (red as the color of a stop sign, yellow for caution), some colors are different across different cultures (white is used for weddings in Western cultures and for funerals in Eastern cultures)

Using light, color, and contrast effectively in UI design

1. Light – create depth using light and shadow
2. Color – use heat to manage focus
3. Contrast – attract attention with higher contrast

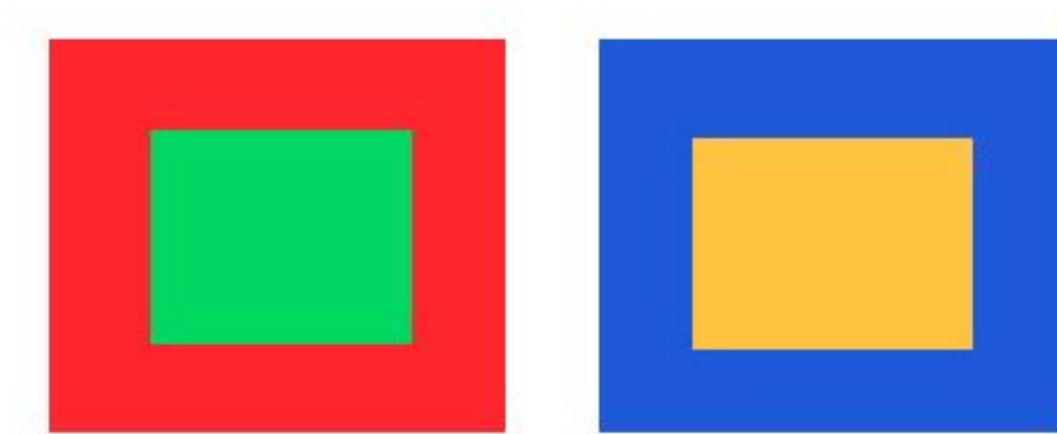

Light – create depth using light and shadow

- Light can be used to create depth
- Lighter shades appear closer to us and darker shades further away
- Color things you want to appear to be sticking out lighter
- Color things that are carved inwards darker

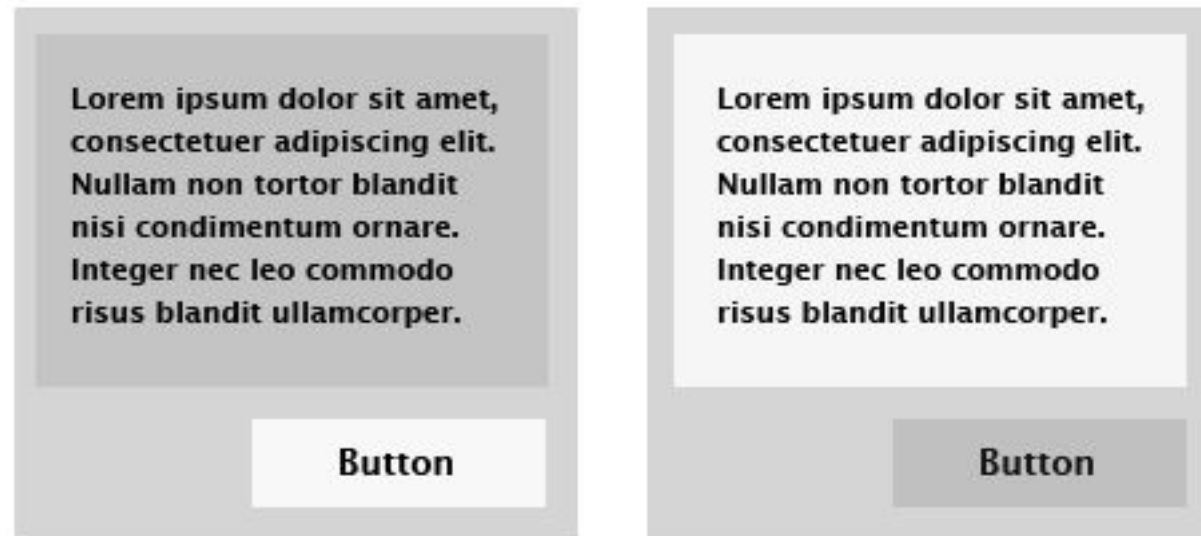

Color – use heat to manage focus

- Warmer colors expand and when placed next to colder colors, they literally spill out and take dominance

Contrast – attract attention with higher contrast

- Higher contrast items stand out – they catch your eyes

- Decrease contrast for less important areas of your UI to make them take a back seat

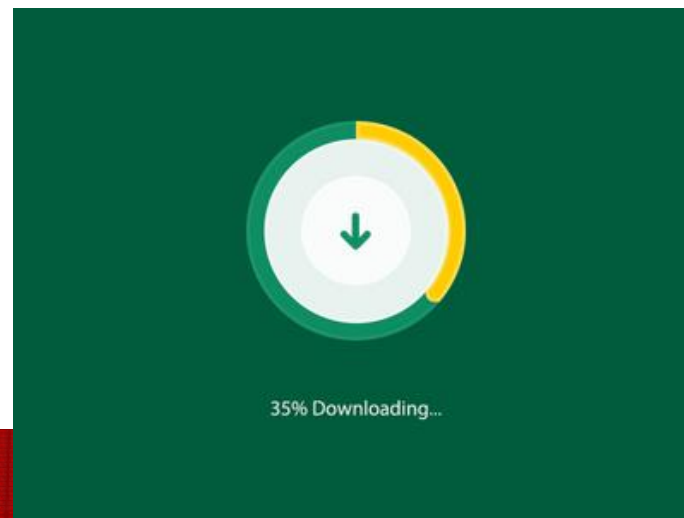

Best Practices for UI Web Design

6. Use color and contrast properly
- 7. Consider feedback messages**
8. Be forgiving
9. Apply agile in design process
10. Using design patterns and tools

Consider feedback messages

- If you typed a message and your phone didn't provide haptic feedback, did you really write that text?
- There's nothing worse than buttons that do nothing
- To keep users from clicking the same button five times just because the site is loading, provide a cue to let them know what's going on

Forgiveness in UI design

- Users make mistakes, no matter how good your user interface is designed
- But there is something you can do about it. There are approaches you can use to allow users to **recover from errors, or even better to prevent errors**
- One such approach is called forgiveness

Feedback and error recovery

- One of the most important aspects of forgiveness is **good feedback**
- Users should be informed about (potential) errors and how they can affect their work
- Good feedback doesn't consist only of well explained error messages
- It also contains actions which users can perform in order to recover from the error.

Error prevention

- Feedback is necessary not only after an error happens; it has an important role in error prevention
- Users should be **warned of possible consequences of their actions**
- A good example is when users want to navigate away from the web form that was edited but not saved
- A confirmation dialog can prevent loss of data.

Forgiving: Undo example

- Undo
 - Undo feature is one of the most common and most useful means of forgiveness
 - If you delete email messages from Gmail inbox you will be able to undo your action immediately
 - Also, deleted messages can be recovered from trash 30 days after deletion

First, know your users

- You've probably heard this a thousand times, and for good reason
- **A successful user interface focuses on users and their tasks**
- When identifying your users, keep in mind that clients are not users, and you are not a user
 - “Knowing how people will use something is essential” –Donald Norman

How to identify users?

- Identifying users can be done using several techniques, such as user interviews, business stakeholder interviews, and the “shadowing” method of observation
- Showing can yield more detailed information about how users perform tasks and what errors they make
- The method is called shadowing because the observer is like a shadow, watching and noting the steps a user takes

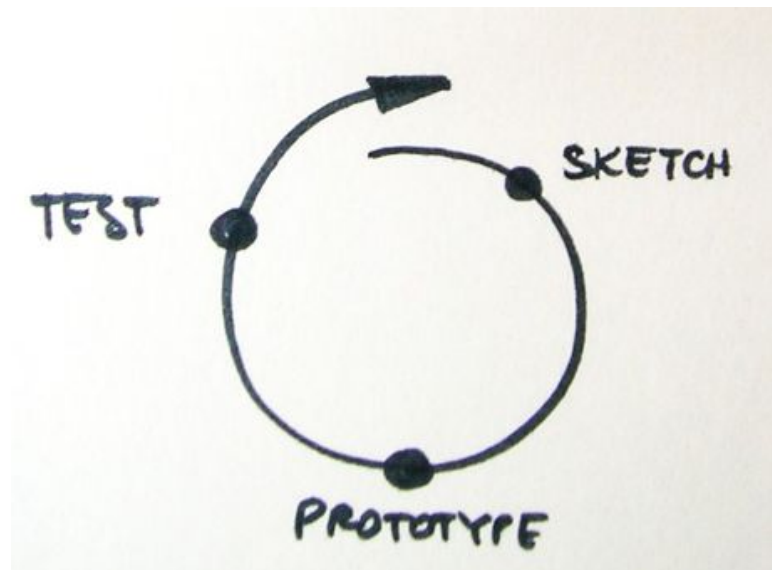

What if we don't have access to real users?

- We can use personas, a tool to help identify users
- Personas are a representation of real users, including their habits, goals, and motivation
- Task analysis helps identify what tasks users perform in their jobs, how they do them, how long they take and what errors they make

Applying agile in design process

- Agile helps through its key principle: the iterative approach
- Each iteration consists of all of the phases defined by the process
- This means that at the end of the first iteration, you will have a product that can be tested, a prototype

Sketching

- Sketches are fast to create and easy to dispose of, which is why they are so powerful
- Are sketches the same as wireframes?
 - No, wireframes don't capture rough ideas but rather develop them
- Once you get the “right” sketches, or at least the ones that you think are right
 - you can create more detailed wireframes or go straight to creating interactive prototypes.

Sketching Techniques

- Sketching != drawing
 - When evaluating your sketches, ask yourself, “How could I better communicate these thoughts?”
 - Getting caught up in evaluating your drawing ability is easy, but try to separate the two.
- Using sticky notes to define tooltips and other interactive elements lets you **quickly define interactions** and concepts
- Free Printable Sketching and Note-Taking PDF Templates
 - <https://www.smashingmagazine.com/2010/03/free-printable-sketching-wireframing-and-note-taking-pdf-templates/>

Exploring interactions

Explore a variety of interactions and ideas in a single sketch using sticky notes.

Sketching Techniques

- Draw on 8.5 × 11" copy paper

Prototyping

- The next step in the process is to create prototypes that will stimulate the real application
- A prototype can contain one or more features (or all of them), but it actually does nothing
- It merely stimulates the behavior of a real application, and users will feel that they are actually doing something

Testing

- Prototypes are useless unless you test them
- You will use this information as the basis of another iteration of sketching, prototyping and testing
- Do this at least until major issues have been fixed
- We all know that software projects are tight on time and budget, so to be more efficient, **test early and test often.**

Best Practices for UI Web Design

6. Use color and contrast properly
7. Consider feedback messages
8. Be forgiving
9. Apply agile in design process
10. **Using prototyping tools**

Prototyping tools

- Prototyping tools bridge the gap between the initial design and the finished product
 - A rough draft to identify what works and what doesn't
- Prototypes server a variety of functions in the web design process
 - Pitch an idea: demonstrate how your idea works
 - User testing: fine-tune the product based on your target user's preferences
 - Proof of concept: get the rest of your team on board with your suggestion
 - Test logic: want to see whether or not an idea will work as you planned
