What is Heuristic

- A rule of thumb for good UI design — not a strict rule
- Proposed by Jakob Nielsen (1994), still the industry standard
- Used to *evaluate* designs: "heuristic evaluation"
- Today: Four heuristics for static pages → the rest when we build interactive pages
- Source: nngroup.com/articles/ten-usability-heuristics

Overview: The 10 Heuristics

- Visibility of system status
- Match between system and the real world ★
- User control and freedom
- Consistency and standards ★
- Error prevention
- Recognition rather than recall ★
- Flexibility and efficiency of use
- Aesthetic and minimalist design ★
- Help users recognize and recover from errors
- Help and documentation

★ = focus today (static pages) — others need interactivity (JavaScript, forms)

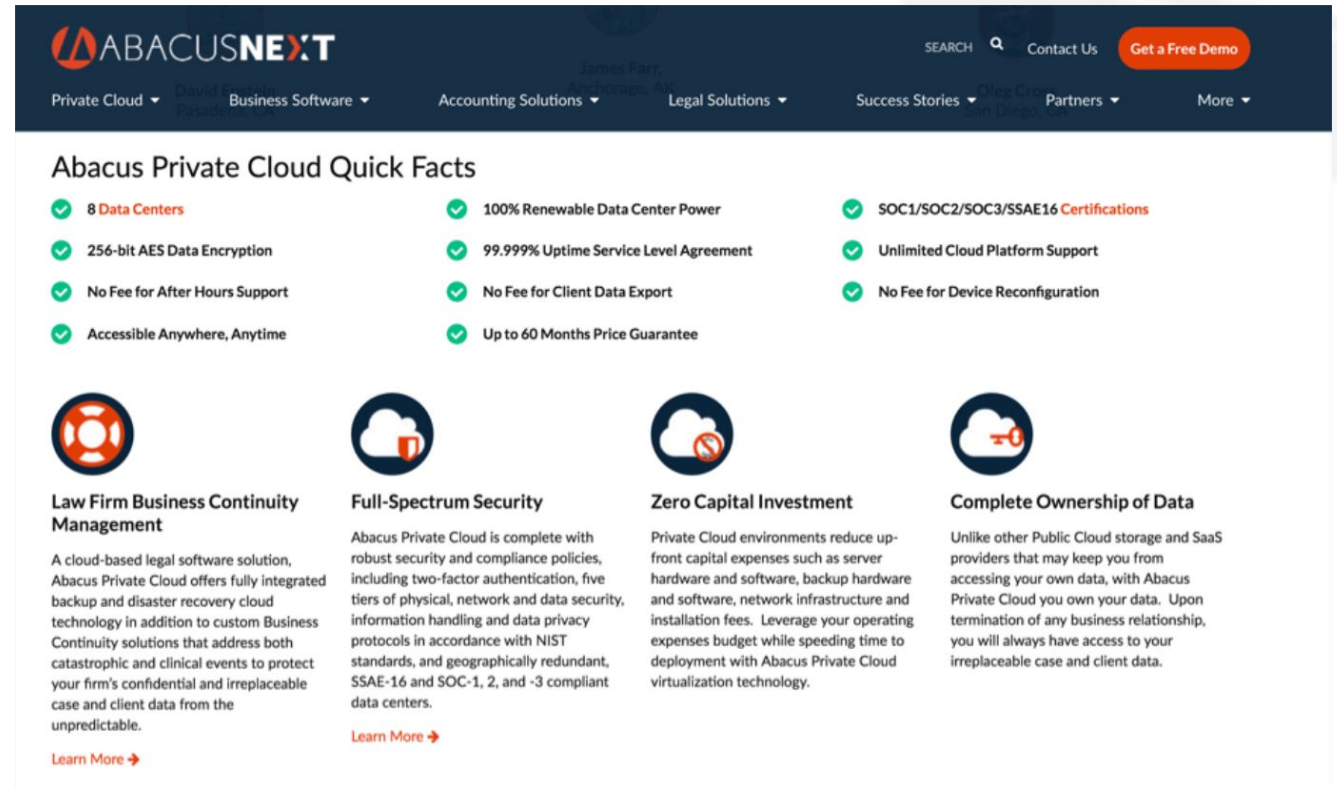

#2 Match Between System and the Real World

- Speak the user's language
 - No jargon, no internal terms
- Familiar icons and metaphors
 -  = cart,  = search)
- Present information in a natural, logical order
-  "Submit query parameters"
 -  "Search"
-  "Error 403"
 -  "You don't have permission to view this page"

Sample Website that Uses Internal Terms

- The About page for Abacus legal software's website uses obscure, overly technical language that places much burden on the user to connect the words with their meaning, such as 256-bit AES Data Encryption and two-factor authentication

The screenshot displays the AbacusNEXT website. The header includes the logo, navigation links (Private Cloud, Business Software, Accounting Solutions, Legal Solutions, Success Stories, Partners, More), a search bar, and a 'Contact Us' button. A prominent orange button labeled 'Get a Free Demo' is also visible.

Zero Capital Investment

Private Cloud environments reduce up-front capital expenses such as server hardware and software, backup hardware and software, network infrastructure and installation fees. Leverage your operating expenses budget while speeding time to deployment with Abacus Private Cloud virtualization technology.

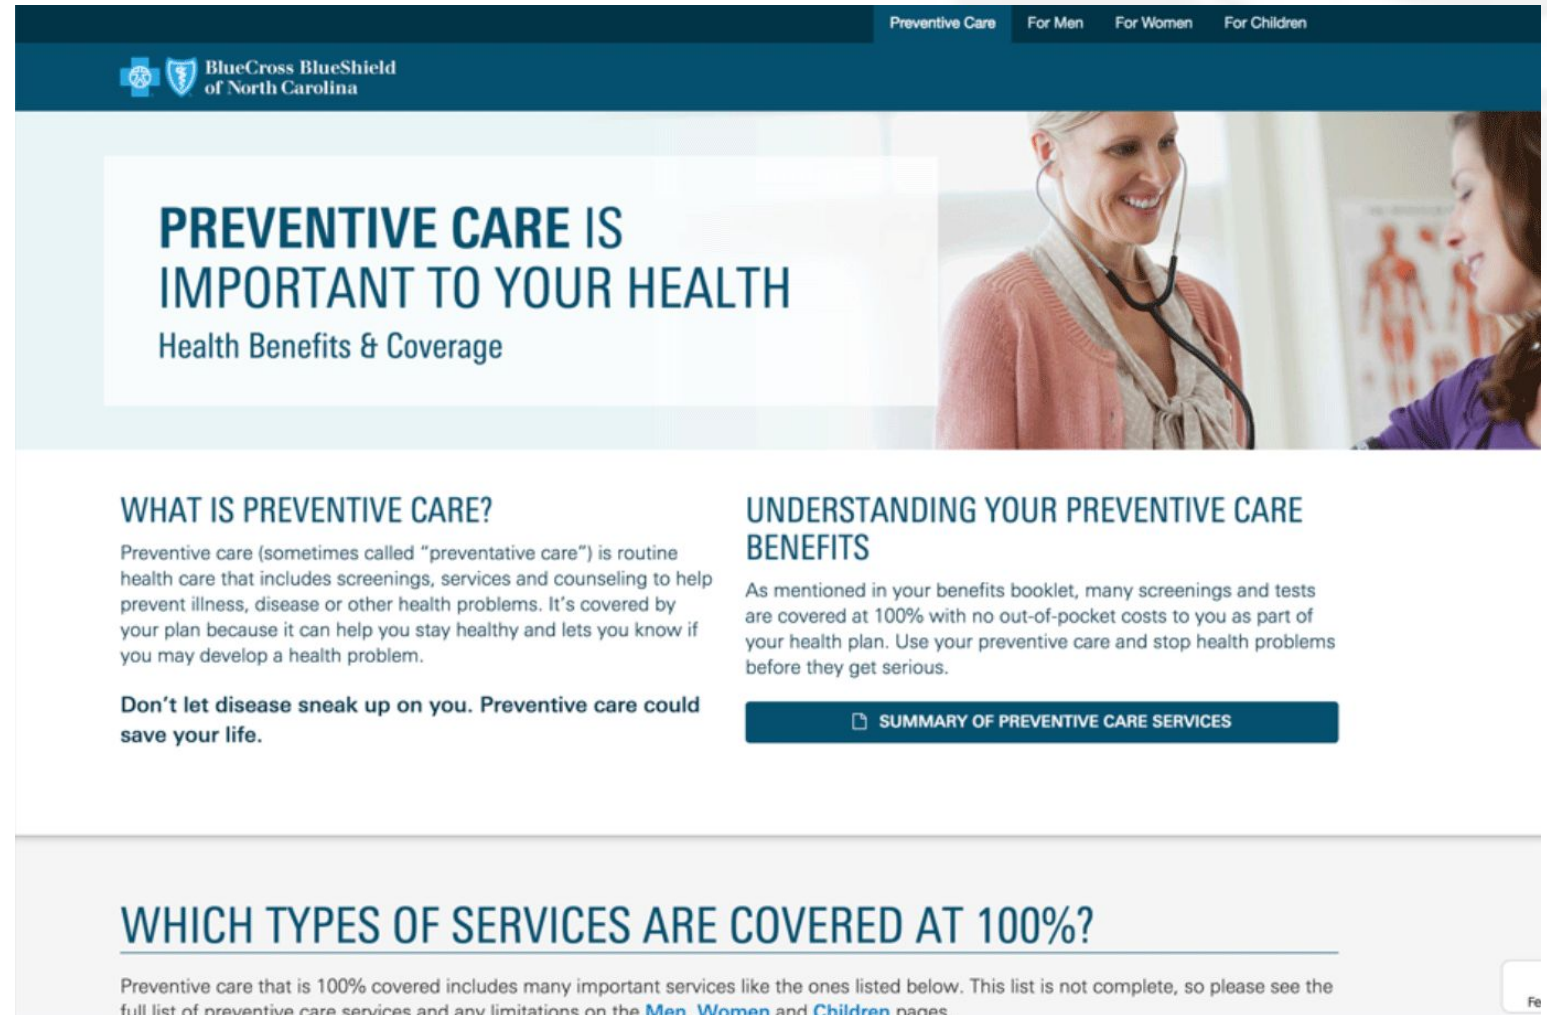

Complete Ownership of Data

Unlike other Public Cloud storage and SaaS providers that may keep you from accessing your own data, with Abacus Private Cloud you own your data. Upon termination of any business relationship, you will always have access to your irreplaceable case and client data.

Sample Website that Do Not Internal Terms

- BlueCross BlueShield of North Carolina provides clear answers to questions, uses familiar language, and includes references that are easy to understand.

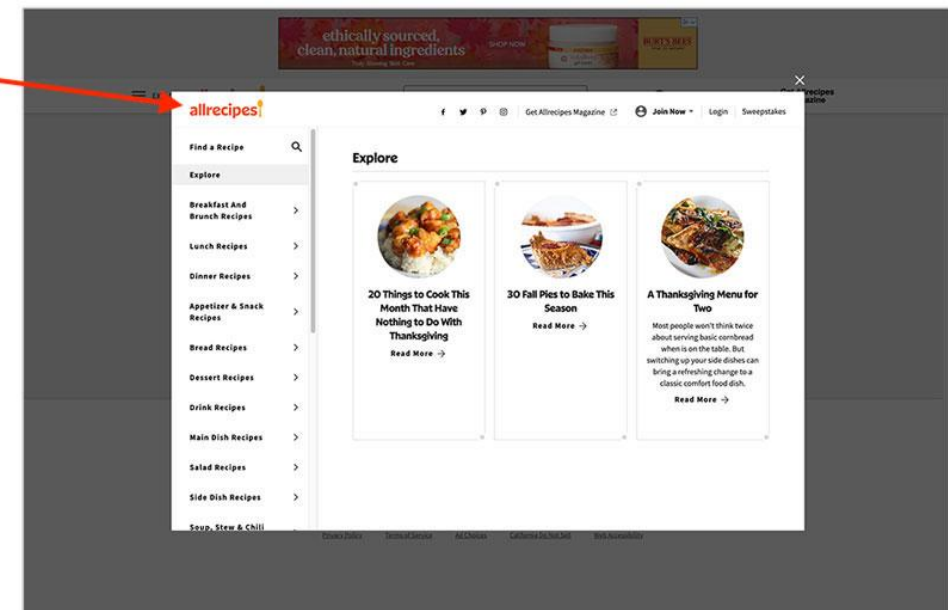

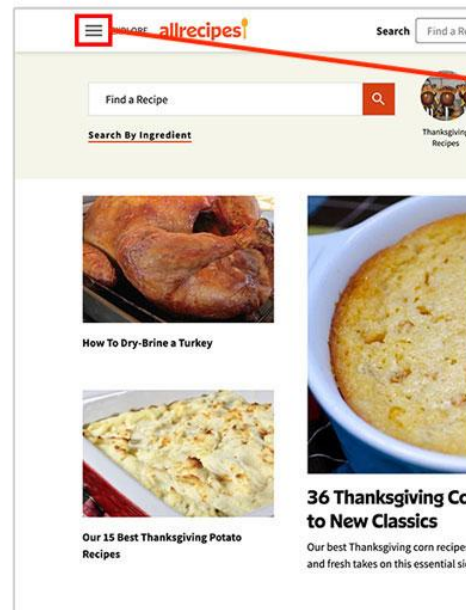

#4 Consistency and Standards

- **Internal consistency**
 - Same colors, fonts, button styles, nav placement on every page
- **External consistency**
 - Follow web conventions users already know
 - Logo (top-left) links to home
 - Links look clickable (color/underline)
 - Navigation at top or left
- Don't make users wonder whether different words/styles mean the same thing

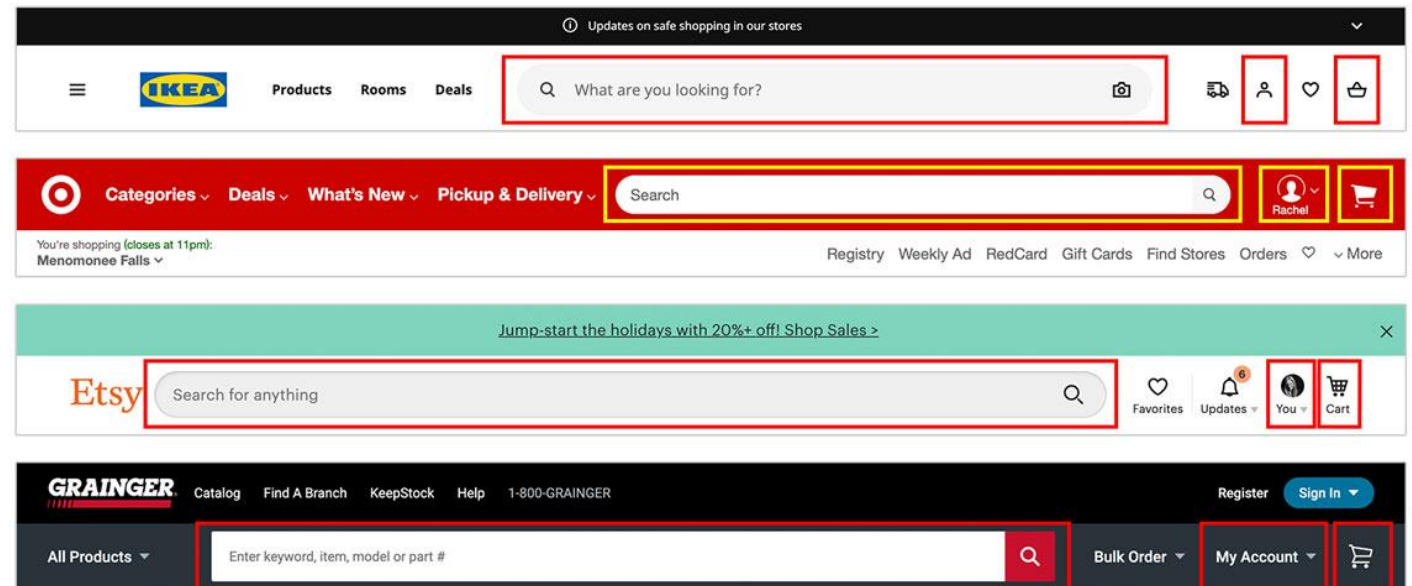

Sample Website that Does Not Follow Convention

- AllRecipes.com hides the primary navigation behind a menu icon (which is a design pattern we do not recommend on desktop)
- However, instead of the menu pulling out from the left when clicked, as is typical with this convention, it is displayed in a modal
- On desktop, modals are commonly associated with newsletter signups and special offers; therefore, users might immediately dismiss it without realizing that they must use the modal to navigate to their desired content.

Sample Websites that Follow Standard

- Ecommerce utility navigation:
Despite the different industries represented in the screenshots above (IKEA, Target, Etsy, and Grainger), these ecommerce websites adhere to the same standards for utility navigation
- A prominent search bar, easy account access, and a clear shopping cart are all displayed in a similar way.

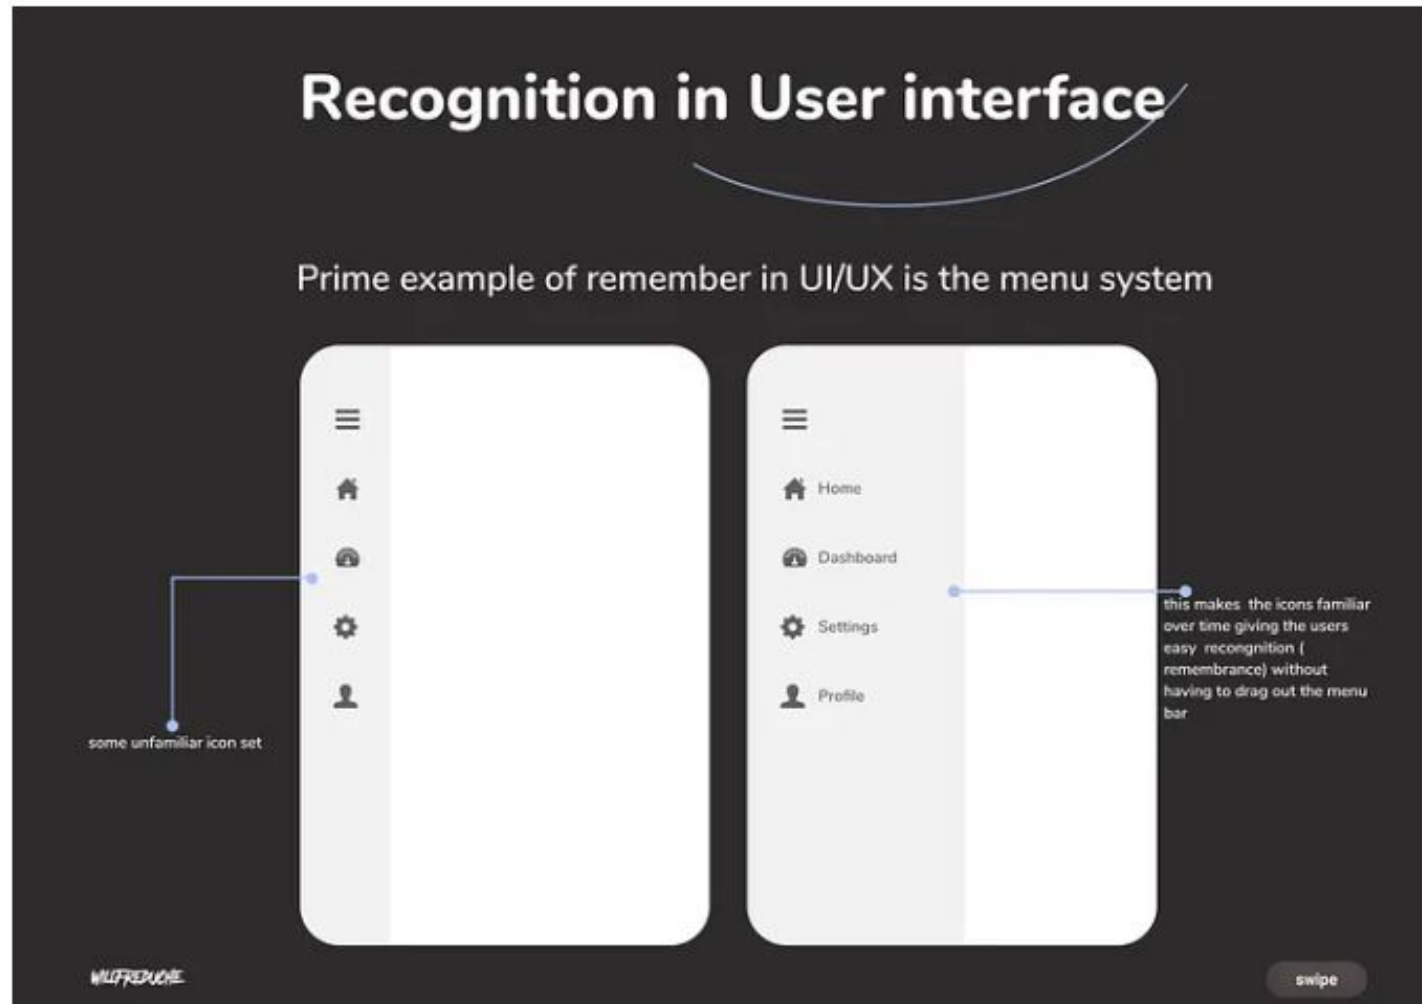

#6 Recognition Rather Than Recall

- Minimize the user's memory load
- Make options and navigation **visible**
 - Don't force users to remember
- Clear, descriptive nav labels: "Portfolio", "Contact"
 - Not clever/vague names
- Show where the user is (highlight current page in nav)
-  Hidden menus with mystery icons
 -  visible labeled navigation

Sample Website that Requires Recognition

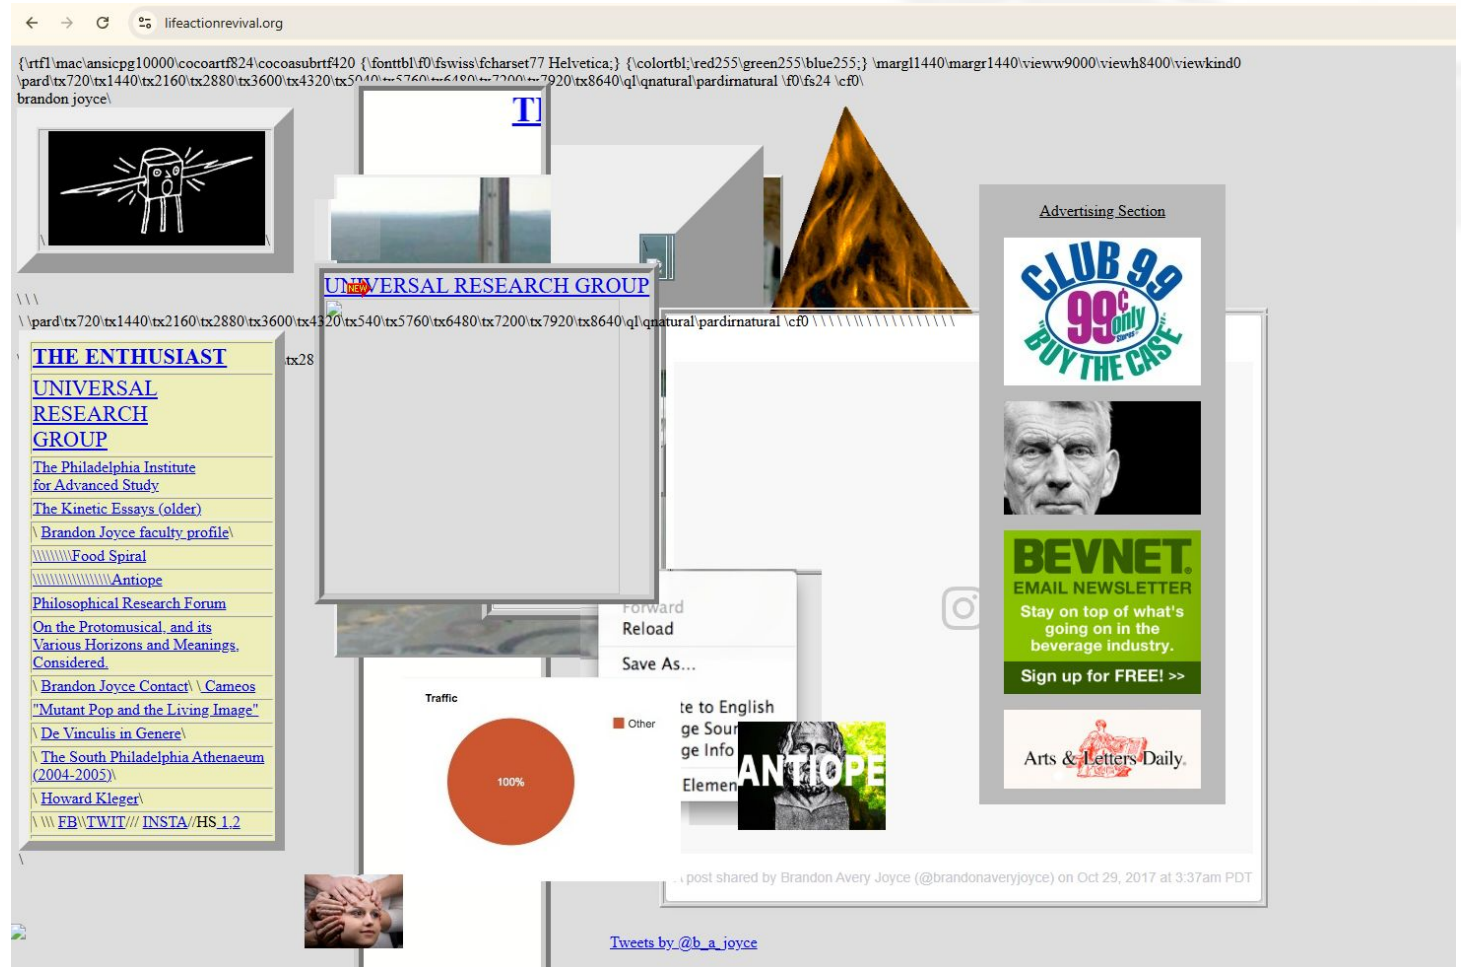

#8 Aesthetic and Minimalist Design

- Minimize the user's memory load
- Make options and navigation **visible**
 - Don't force users to remember
- Clear, descriptive nav labels: "Portfolio", "Contact"
 - Not clever/vague names
- Show where the user is (highlight current page in nav)
-  Hidden menus with mystery icons
 -  visible labeled navigation

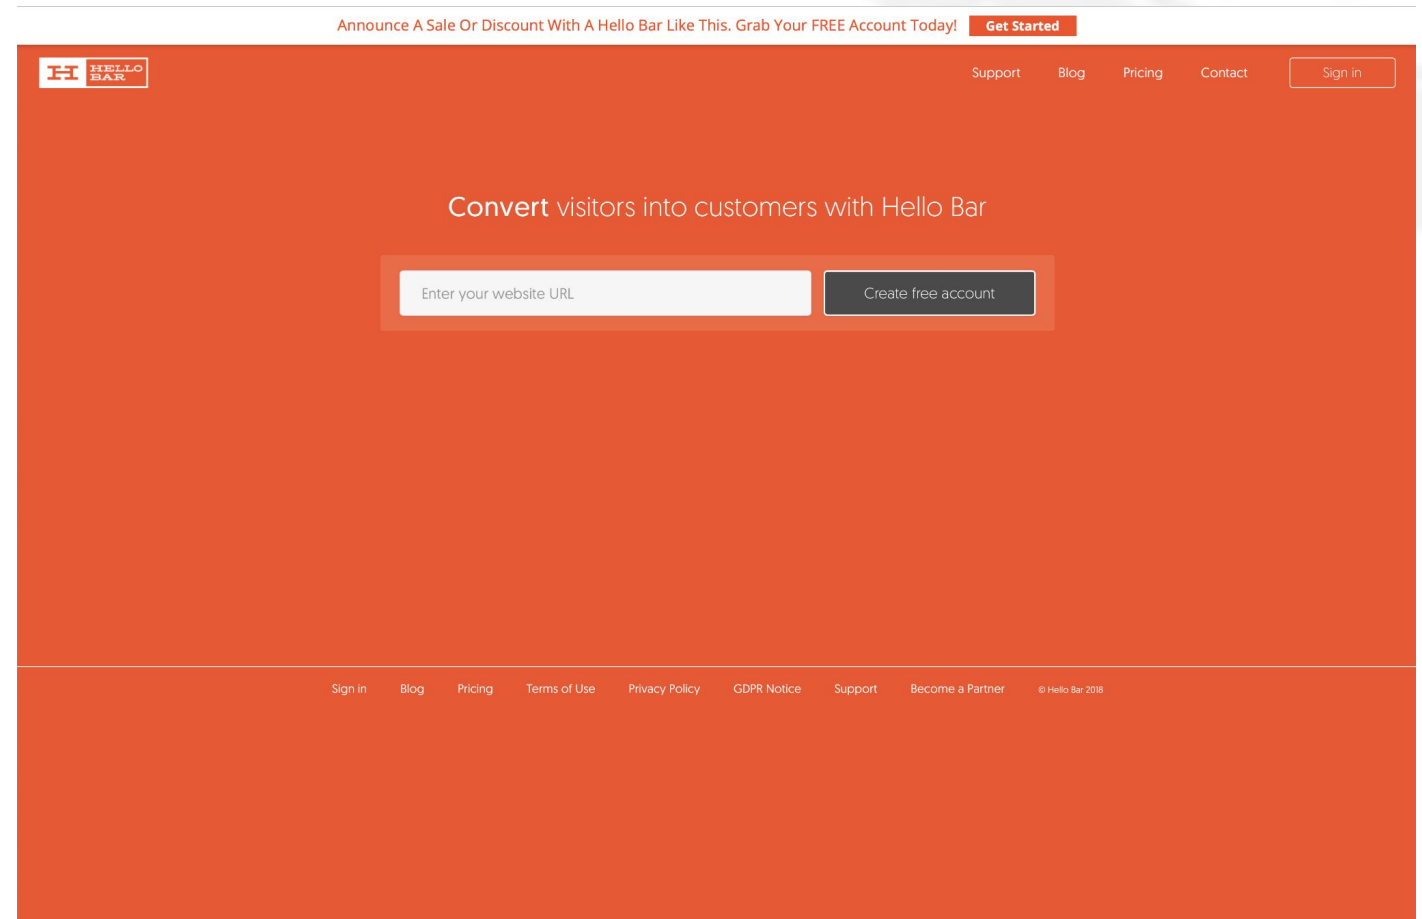

Sample Website with Irrelevant Information

- If nobody told you what they're all about, you couldn't figure it out by visiting the page.

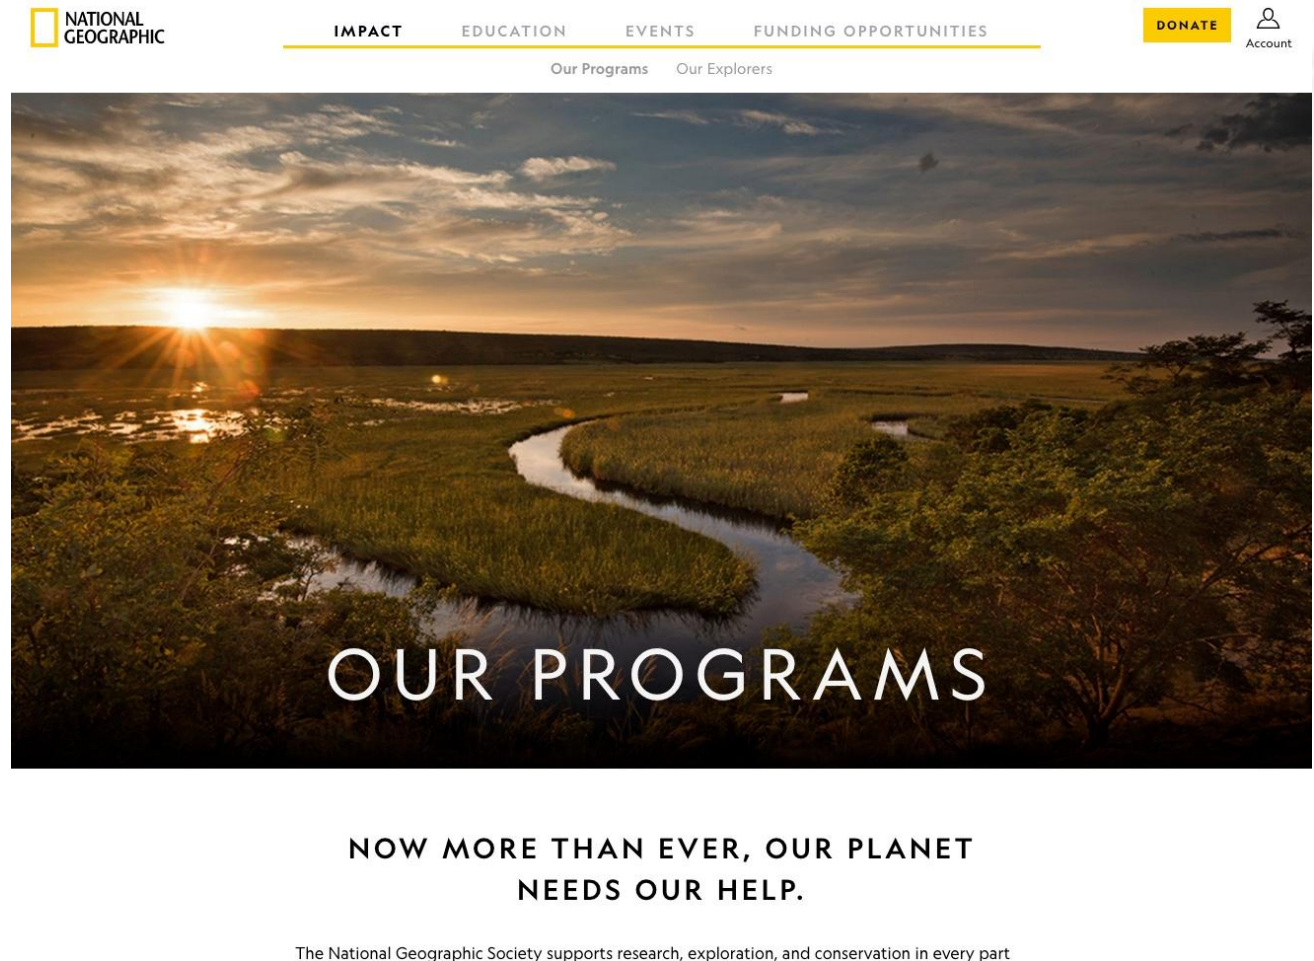

Sample Website with Irrelevant Information

- The HelloBar homepage is extremely minimalist in visual style
- However, there is not sufficient information about what the company does or what features are available
- Thus, while it may follow the minimalist design trend, it does not satisfy the heuristic, because it does not have necessary information in an easily findable place.

Sample Website with Aesthetic and Minimalist Design

- National Geographic's website effectively uses scale, visual hierarchy, balance, contrast, and Gestalt principles to create an aesthetically-pleasing, usable design
- It also highlights where we are by making the current menu color blank while the color of other menus is grey

Summary

- Four heuristics for static pages:
 - **Real-world match**
 - **Consistency**
 - **Recognition**
 - **Minimalist design**
- Use them as a checklist when designing in Figma
